

After we've confirmed your interview schedule, you'll be sent a PDF with additional information. Read through the PDF to familiarize yourself with the rules of the game. At the time of the interview, you'll be set up with a HackerRank environment and asked to code the solution into three separate parts. You may opt for any language of your choice, but we highly recommend avoiding Java.

A few tips for this interview:

- **Understand the problem:** take the first few minutes to familiarize yourself with the problem before you start coding. Ask clarifying questions if needed.
- **Think Aloud:** while this interview is focused on assessing your coding ability, you are encouraged to verbalize your thought process as you code. Our engineers want to understand your approach and problem-solving skills.
- **Clean Code:** one of the key assessment criteria is the ability to demonstrate the consistent application of coding principles, and you should be able to recognize specific areas for improvement.
- **Progress/Efficient Execution:** the focus is on delivering the functionality required, at a good velocity, to ensure you're able to complete all three parts of the exercise.
- **Testing & Optimizing:** you should be able to demonstrate comfort in your developer environment, and proficiency in navigation, debugging, and research. You'll also be assessed on how able you are to quickly unblock yourself, and to bypass unfamiliar problems through documentation or external resources. You will be asked to share your screen as part of this interview. Note that the use of an LLM during this interview will result in an automatic fail.

Additional Resources

Books:

- "Cracking the Coding Interview"

Author: Gayle Laakmann McDowell

- "Programming Pearls"

Author: Jon Bentley. Programming questions that get you to start thinking outside of the box-- always useful.

This is not a typical LeetCode puzzle — it's a fast-paced implementation task. You will be asked to build a system with many moving parts, similar to a simulator, where the rules keep changing as you code. The goal is to see how well you handle a large volume of logic without letting your code turn into spaghetti.

Focus on writing clean, modular Object-Oriented Programming. This will allow you to add new features quickly without breaking what you've already built.

Skip the algorithm tricks — what matters here is your ability to build a bug-free system from a long list of requirements.

And one more thing - do not spend much time on the intro at the beginning of the interview - save this time for coding

You should use one of the following languages: Python, JS, TS, C#, C++ Go, or Java

Good Luck! I will be in touch with you following your interviews to share feedback and the next steps in the process.
